Folding Arm Awning

Do you want

- A large shaded area? Up to 3.6 metres extension from the wall
- To be able to walk around underneath the awning?
- Shade which rolls right back in winter when it is not needed?
- Optional electric motor?

Then the **Folding Arm awning** is the solution for you.

Ideal as a roll away cover for patios and terraces where sun protection is required and it is necessary to walk around underneath.

The arms extend horizontally instead of vertically as in other awnings. **The Folding Arm awning** is cantilevered from the wall so that the arms do not get in the way. Your choice is Telescopic or conventional Folding arms

With sufficient slope, the awning will withstand light showers but it should be considered as a sunscreen rather than as a retractable roof due to wind restrictions.

Crank handle or electric motor can operate the **Folding Arm awning** . Electric motors are essential where the awning has more than two arms (greater than 6000mm width). With electric motors totally automatic operation with wind, sun rain sensors or timers is then a possibility.

"Variable Valance" is optional on some **Folding Arm** awnings. This enables you to extend the valance of the awning as the sun moves across the sky.

Maximum width with standard valance is 18000mm

Maximum width with variable valance is 6000mm
